#### **PREFACE**

This product specification covers the work performed under Air Force Contract F33615-80-C-5155 (ICAM Project 6201). This contract is sponsored by the Materials Laboratory, Air Force Systems Command, Wright-Patterson Air Force Base, Ohio. It was administered under the technical direction of Mr. Gerald C. Shumaker, ICAM Program Manager, Manufacturing Technology Division, through Project Manager, Mr. David Judson. The Prime Contractor was Production Resources Consulting of the General Electric Company, Schenectady, New York, under the direction of Mr. Allan Rubenstein. The General Electric Project Manager was Mr. Myron Hurlbut of Industrial Automation Systems Department, Albany, New York.

Certain work aimed at improving Test Bed Technology has been performed by other contracts with Project 6201 performing integrating functions. This work consisted of enhancements to Test Bed software and establishment and operation of Test Bed hardware and communications for developers and other users. Documentation relating to the Test Bed from all of these contractors and projects have been integrated under Project 6201 for publication and treatment as an integrated set of documents. The particular contributors to each document are noted on the Report Documentation Page (DD1475). A listing and description of the entire project documentation system and how they are related is contained in document FTR620100001, Project Overview.

The subcontractors and their contributing activities were as follows:

#### Subcontractors

#### Role

Boeing Military Aircraft Company (BMAC)

Responsible for consultation on applications of the technology and on IBM computer technology.

Computer Technology Associates (CTA)

Assisted in the areas of communications systems, system design and integration methodology, and design of the Network Transaction Manager.

Control Data Corporation (CDC)

Responsible for the Common Data Hodel (CDM) implementation and part of the CDM design (shared with DACOM).

D. Appleton Company (DACOM)

Responsible for the overall CDM Subystem design integration and test plan, as well as part of the design of the CDM (shared with CDC). DACOM also developed the Integration Methodology and did the schema mappings for the Application Subsystems.

#### SECTION 1

#### SCOPE

# 1.1 Identification

This specification establishes the detailed design of a computer program identified as the Forms Language Compiler, hereinafter referred to as FLAN. FLAN is one configuration item of the Integrated Information Support System (IISS) User Interface (UI).

#### 1.2 Functional Summary

FLAN is a compiler which translates Form Definition Language source files into binary Form Definition File format. The binary Form Definition Files are then used as input by the Form Processor (another configuration item of the IISS UI) for display and entry of data under the control of other application programs.

### 2.2 Terms and Abbreviations

Application Definition Language: an extension of the Forms Definition Language that includes retrieval of database information and conditional actions. It is used to define interactive application programs.

Attribute: field characteristic such as blinking, highlighted, black, etc. and various other combinations. Background attributes are defined for forms or windows only. Foreground attributes are defined for items. Attributes may be permanent, i.e., they remain the same unless changed by the application program, or they may be temporary, i.e., they remain in effect until the window is redisplayed.

Common Data Model: (CDM), IISS subsystem that describes common data application process formats, form definitions, etc. of the IISS and includes conceptual schema, external schemas, internal schemas, and schema transformation operators.

Display List: is similar to the open list, except that it contains only those forms that have been added to the screen and are currently displayed on the screen.

Field: two dimensional space on a terminal screen.

Form: structured view which may be imposed on windows or other forms. A form is composed of fields. These fields may be defined as forms, items, and windows.

Form Definition: (FD), forms definition language after compilation. It is read at runtime by the Form Processor.

Forms Definition Language: (FDL), the language in which electronic forms are defined.

Form Editor: (FE), subset of the IISS User Interface that is used to create definitions of forms. The FE consists of the Forms Driven Form Editor and the Forms Language Compiler.

Form Hierarchy: a graphic representation of the way in which forms, items and windows are related to their parent form.

Forms Language Compiler: (FLAN), subset of the FE that consists of a batch process that accepts a series of forms definition language statements and produces form definition files as output.

Form Processor: (FP), subset of the IISS User Interface that consists of a set of callable execution time routines available to an application program for form processing.

Integrated Information Support System: (IISS), a test computing environment used to investigate, demonstrate and test the concepts of information management and information integration in the context of Aerospace Manufacturing. The IISS addresses the problems of integration of data resident on heterogeneous data bases supported by heterogeneous computers interconnected via a Local Area Network.

Item: non-decomposable area of a form in which hard-coded descriptive text may be placed and the only defined areas where user data may be input/output.

Message: descriptive text which may be returned in the standard message line on the terminal screen. They are used to warn of errors or provide other user information.

Operating System: (OS), software supplied with a computer which allows it to supervise its own operations and manage access to hardware facilities such as memory and peripherals.

Page: instance of forms in windows that are created whenever a form is added to a window.

Paging and Scrolling: a method which allows a form to contain more data than can be displayed with provisions for viewing any portion of the data buffer.

Qualified Name: the name of a form, item or window preceded by the hierarchy path so that it is uniquely identified.

Subform: a form that is used within another form.

User Interface: (UI), IISS subsystem that controls the user's terminal and interfaces with the rest of the system. The UI consists of two major subsystems: the User Interface Development System (UIDS) and the User Interface Management System (UIMS).

User Interface Development System: (UIDS), collection of IISS User Interface subsystems that are used by applications programmers as they develop IISS applications. The UIDS includes the Form Editor and the Application Generator.

Window: dynamic area of a terminal screen on which predefined forms may be placed at run time.

#### SECTION 3

#### REQUIREMENTS

# 3.1 Structural Description

The detailed structure of the Forms Language Compiler is illustrated in section 3.10. The four major subsystems are:

- Stand alone FLAN
- Integrated FLAN
- Reverse FLAN (REVFLAN)
- MAKINC

#### 3.1.1 Stand Alone FLAN

Stand alone FLAN is a batch process which resembles a normal computer language compiler in concept and use. It accepts a series of Form Definition Language statements (FDL) file) as input and produces one or more Form Processor Form Definition (fd) files as output.

FLAN is partially generated by the UNIX tool YACC. The file FLAN.Y, which contains the YACC specifications for FLAN, is the input file to YACC. YACC generates the Forms Language parser, YTAB.C.

Figure 3-1 YACC Structural Description

Some support routines for the parser (FLANSP.C) were coded from scratch along with the module WRTFRM.C that writes the form definition files. Figure 3-2 describes the major module relationships for stand alone FLAN.

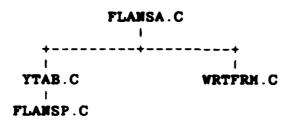

Figure 3-2 Stand Alone FLAN Module Relationships

# 3.1.2 Integrated FLAN

Integrated FLAN is available within the IISS environment. It makes use of the batch compiler but interfaces to the user through forms. The modules FLFRNT.C and FLUIERR.C do the interfacing with the IISS user. FLFRNT.C processes the form and FLUIERR.C performs error handling. Figure 3-3 describes the major module relationships for the integrated FLAN.

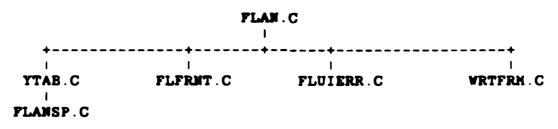

Figure 5-3 Integrated FLAN Module Relationships

# 3.1.3 Reverse FLAN

Reverse FLAN (REVFLAN) is a batch process that generates Form Definition Language specifications from Form Processor Form Definition (fd) files.

#### 3.1.4 MAKING

MAKING is a batch process that generates a data structure corresponding to the item fields in a form and its static subforms. These data structures can be used in application programs as include files when calling the Form Processor routines GDATA and PDATA.

### 3.2 Functional Flow

# 3.2.1 Stand Alone FLAN

Figure 3-4 is a data flow diagram of Stand Alone FLAN. The Compile Language File process is almost entirely generated by YACC.

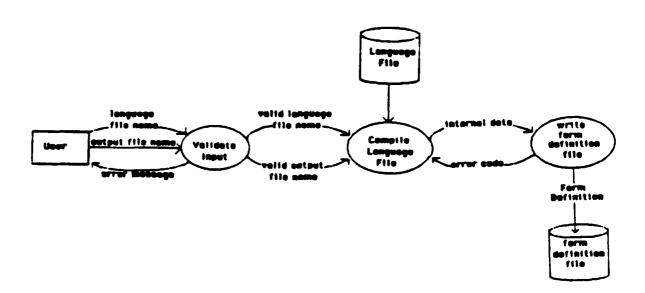

Figure 3-4 Stand Alone FLAN Data Flow

# 3.2.2 Integrated FLAN

Figure 3-5 is a data flow diagram of Integrated FLAN.

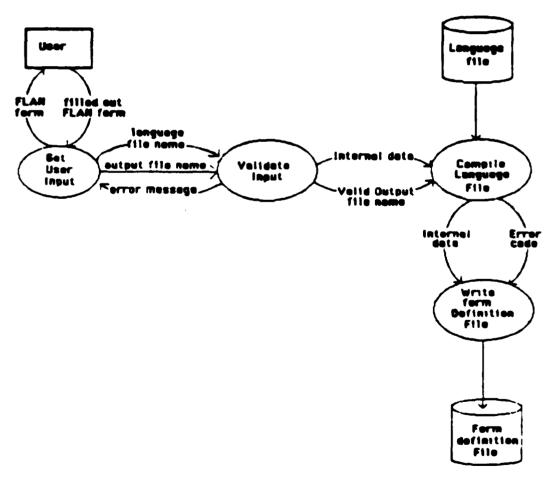

Figure 3-5 Integrated FLAN Data Flow

# 3.2.3 Reverse FLAN

Figure 3-6 is a data flow diagram of Reverse FLAN.

Figure 3-6 Reverse FLAN Data Flow

# 3.2.4 MAKINC

Figure 5-7 is a data flow diagram of MAKINC.

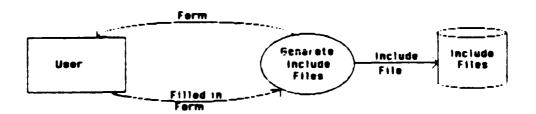

Figure 3-7 MAKING Data Flow

#### 3.3 Interfaces

#### 3.3.1 Form Processor

The Form Definition files generated by FLAN are used as input to the Form Processor. The format of these files is described in section 3.7.1.1.

#### 3.3.2 Forms Driven Form Editor

The Forms Driven Form Editor (FDFE) generates Form Definition Language (fdl) files and compiles them using code that it shares with FLAN. The FLAN modules YTAB.C, FLANSP.C, WRTFRM.C, and FLUIERR.C are used by the FDFE.

# 3.3.3 Report Writer

The Report Writer (RW) uses FLAN to parse its input language file and to generate its fd files. The FLAN modules YTAB.C. FLANSP.C. WRTFRM.C. and FLUIERR.C are used by the RW.

# 3.3.4 Rapid Application Generator

The Rapid Application Generator uses FLAN to parse its input language file and to generate its fd files. The FLAN modules YTAB.C, FLANSP.C, WRTFRM.C, and FLUIERR.C are used by the Rapid Application Generator.

# 3.3.5 Application Interface

Integrated FLAN is an application that uses forms to communicate with the terminal user. Integrated FLAN accomplishes this communication by calling Application Interface routines. Figure 3-8 describes this interface.

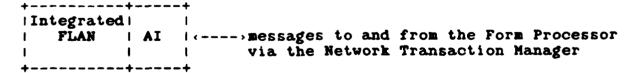

Figure 3-8 Integrated FLAN Application Interface

## 3.4 Program Interrupts

This section does not apply to the detailed design of the Forms Language Compiler.

# 3.5 Timing and Sequencing Description

The data flow diagrams in section 3.2 and the detail design description in section 3.10 contain the procedural information for sequencing and control logic.

### 3.6 Special Control Features

The detailed design of the Forms Language Compiler does not include any special control features as defined in the ICAM Documentation Standards manual.

# 3.7 Storage Allocation

The executable sizes for Stand Alone FLAN, Integrated FLAN, Reverse FLAN, and MAKINC are:

| Stand Alone FLAN | 138 | blocks |
|------------------|-----|--------|
| Integrated FLAN  | 186 | blocks |
| Reverse FLAN     | 47  | blocks |
| MAKINC           | 102 | blocks |

#### 3.7.1 Data Base Definition

#### 3.7.1.1 File Descriptions

1. FILE NAME: FLAN.Y - Sequential file containing the YACC specifications for the FLAN parser.

PURPOSE: This file is used by YACC to generate the source file YTAB.C which is the parser for FLAN.

#### **DECLARATION:**

char line [132]:

2. FILE NAME: name.FDL - Form Definition Language file.

PURPOSE: This file contains the language description of one or more forms. It is compiled to produce Form Definition files.

#### **DECLARATION:**

char line [132];

3. FILE NAME: formname.FD - Form Definition file. The name of this file is dependent upon the form it describes.

PURPOSE: This file contains information about the structure and attributes of a form that is used at run time by the Form Processor.

#### **DECLARATION:**

  } FLDREC:
```

4. FILE NAME: formname.inc - This include file is generated by MAKINC and contains the data declaration that corresponds to the form definition. Its name is dependent upon its corresponding form.

PURPOSE: These include files are used by application programs that use the Form Processor. Generating these include files from the form definitions eliminates the need for editing the application code whenever data definitions for form variables change.

DECLARATION: dependent on Form Definition file

# 3.8 Object Code Creation

The FLAN routine YTAB.C was generated by the UNIX tool YACC. It is compiled like any other C program. All other modules were compiled using a C compiler developed by Interactive Software under VAX/VMS.

# 3.9 Adaptation Data

The C source modules for the Forms Language Compiler can be compiled using any UNIX version 7 compatible C compiler. The YTAB.C module can be used just as any other C module, but it can only be generated with YACC.

The files FPDINI.H and GETFLS.C contain file names for the form definition and forms definition language files which may not port to systems other than VAX/VMS.

# 3.10 Detailed Design Description

# 3.10.1 Main Program List

The following is a list of all "Main Programs" which are modules that are not called by any other module being documented here. These modules are either program entry points or, if they are hooked into another set of programs via subroutine calls, they are the points the external programs can call and therefore enter through. To differentiate between the two types of entry points, look at the individual Module Documentation (section 3.10.8) and look at Module Type for each of the Main Program modules listed. Note whether the routine is a Program, Subroutine, or Function. If it is a Program, it is truly a main program entry point. If not, then it is merely called by other programs not being documented here.

# 3.10.4 Include File List

The following is a list of all include files called in by modules being documented here. Each include file has a unique name regardless of the language being used. The purpose of each include file is listed as well. A more complete description of each include file is given in section 3.10.9. The purpose listed is the one that is in the source code of the include file.

A purpose of """" PURPOSE NOT FOUND BY STRIPPER """ indicates that a purpose statement was not written into the include file itself. The most common reason for this is that the include file comes from system libraries that were not developed by the project, such as 'C' libraries that are provided with the 'C' compiler.

See section 3.10.6 for a set of lists which show all the modules which call in each of these include files.

# FORMS LANGUAGE COMPILER Include File List

## 3.10.7 Main Program Parts List

The following lists each Main Program listed in 3.10.1 and all the modules which are called either by that module itself or by any of the documented modules which it calls. It is possible for a non-main module to be listed more that once if it is called by multiple modules. The called modules, in this case known as program parts, are marked as to whether they are documented here. If so, the phrase "well-defined module" appears by the module name, if not it is an "external "routine". The Purpose of the Main Program module is listed as well.

| Main Pgm<br>Name | Module<br>Name          | Module<br>Type  |
|------------------|-------------------------|---|
|                  |                         | Purpose>FLAN MAIN PROGRAM External routine Well-defined module External routine External routine External routine External routine External routine Well-defined module Well-defined module Well-defined module External routine |
|                  | MAKSTR<br>MALLOC<br>MAX | Well-defined module<br>External routine<br>External routine   |

### 3.10.8 Module Documentation

The following documentation describes information which is specific to each individual module being documented in this specification as listed in section 3.10.2. It provides a compact way of getting information that would be otherwise buried within each module's source code.

The specific items in this module documentation have the following meanings:

NAME:

Name of program Module.

PURPOSE:

Purpose of Module as detailed in the

source code.

LANGUAGE:

Programming language source code is

written in.

The choices are:

VAX-11 FORTRAN

C

(I/S-1 Workbench 'C') VAX-11 COBOL

MODULE TYPE:

Whether a Program, Subroutine, or

Function.

SOURCE FILE:

Name of Source File from file

specification.

SOURCE FILE TYPE:

Source File Extension from file

specification.

HOST:

Whether this is a host-dependent routine (VAX or IBM) or blank if

host-independent.

SUBSYSTEM:

IISS sub-system this file resides in.

SUBDIRECTORY:

Sub-directory of that subsystem in

which this file resides.

DOCUMENTATION GROUP:

Name of documentation group of which

this source file is a member.

DESCRIPTION:

A description of the module as otained

from the source code.

ARGUMENTS: The arguments with which this routine

is called if it is a Subroutine or a

Function.

INCLUDE FILES: A list of all the files that are

included into this module as well as

their purposes.

ROUTINES CALLED: Subroutines or Functions, either

documented or external, called by

this module, if any.

CALLED DIRECTLY BY: The documented routines which call

this module, if any.

USED IN MAIN PROGRAM(S): The documented Main Programs which

contain this module in their parts list according to the list in section

3.10.7.

The Module Documentation is arranged alphabetically according to Module Name.

DESCRIPTION

#### FORMS LANGUAGE COMPILER Include File Description

FILE NAME: STDTYP

PURPOSE: STANDARD TYPE DEFINITIONS

LANGUAGE: C

**DESCRIPTION:** 

\_\_\_\_\_

#### DESCRIPTION

THIS FILE ENSURES THAT THE FOLLOWING STANDARD TYPES ARE AVAILABLE:

FLOAT - SINGLE PRECISION FLOAT DOUBLE - DOUBLE PRECISION FLOAT

LONG - 32 BIT (OR LARGER) SIGNED INTEGER

- 32 BITS (OR MORE) FOR BIT MANIPULATION LBITS

- NATURAL SIZE SIGNED INTEGER UNSIGNED - NATURAL SIZE UNSIGNED INTEGER

BOOL - NATURAL SIZE LOGICAL (ZERO / NON-ZERO ONLY)

SHORT - 16 BIT (OR LARGER) SIGNED INTEGER - 16 BIT (OR LARGER) UNSIGNED INTEGER USHORT - 16 BITS (OR MORE) FOR BIT MANIPULATION BITS

CHAR - SINGLE MACHINE CHARACTER (REAL CHARACTERS

ALWAYS POSITIVE)

TINY - 8 BIT (OR LARGER) SIGNED INTEGER UTINY - 8 BIT (OR LARGER) UNSIGNED INTEGER TBITS - 8 BITS (OR MORE) FOR BIT MANIPULATION

- 8 BIT (OR LARGER) LOGICAL (ZERO / NON-ZERO TBOOL

ONLY)

METACHAR - 16 BIT (OR LARGER) AUGMENTED CHARACTER (SIGNED)

- FUNCTION THAT RETURNS NO VALUE VOID

FORTRAN - STORAGE CLASS FOR FOREIGN (NON-C) ROUTINES OR C ROUTINES

WHICH ARE CALLABLE FROM FOREIGN ROUTINES

SINCE NOT ALL COMPILERS SUPPORT USHORT, TINY, AND UTINY, THE FUNCTIONS

USHORT(), TINY(), AND UTINY() SHOULD BE USED WHENEVER REFERENCING THEM.

IN ADDITION. THE FOLLOWING UTILITY MACROS ARE DEFINED:

LURSHIFT(N. B) - UNSIGNED LONG RIGHT SHIFT

MAX(A, B) - MAXIMUM OF A AND B MIN(A, B) - MINIMUM OF A AND B

#### FORMS LANGUAGE COMPILER Include File Description

ABS(A) - ABSOLUTE VALUE OF A

STRASN(A, B) - TRANSPORTABLE A = B FOR STRUCTURES

NULL - NULL POINTER VALUE (0)

TRUE - 1 FALSE - 0

SUCCESS - EXIT(SUCCESS) INDICATES SUCCESSFUL

COMPLETION

FAILURE - EXIT(FAILURE) INDICATES ERRORS

# THE FOLLOWING SYMBOLS SHOULD BE DEFINED BASED ON THE COMPILER BEING USED:

USHORT - COMPILER SUPPORTS UNSIGNED SHORT TINY - COMPILER TREATS CHAR AS SIGNED

UTINY - CHAR IS SIGNED AND COMPILER SUPPORTS

UNSIGNED CHAR

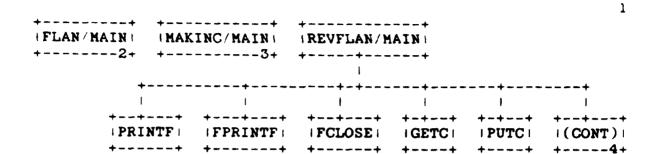

VOID - COMPILER SUPPORTS VOID FORTRAN - COMPILER SUPPORTS FORTRAN STRASN - DEFINE APPROPRIATE MACRO

SUCCESS - DEFINE APPROPRIATE VALUE IF NOT 0 FAILURE - DEFINE APPROPRIATE VALUE IF NOT 1

#### 3.10.10 Hierarchy Chart

The following hierarchy charts show the relationships between all of the modules mentioned in the above documentation. A module may call a subroutine several times within its code, but the call will only be shown once as a single relationship on this hierarchy chart. All modules shown at the top of the first page are considered Main Programs as described in section 3.10.1 above.

There is an internal paging scheme as marked by the numbers in the upper right corner of each page. An index after the last page of the chart shows where a routine and its calls are first defined. If a routine has no page reference, it either makes no calls or is an external routine. A continuation box on the end of a tree limb shows where that the tree continues on the page numbered mentioned. A number in a box with a routine name points to the page where the routine is further defined within the hierarchy tree. If there is no number in a box, the routine either makes no calls or is an external routine.

# 3.11 Program Listings Comments

This information is contained in the Module Descriptions in section 3.10.

### SECTION 4

# QUALITY ASSURANCE PROVISIONS

#### 4.1 Introduction and Definitions

"Testing" is a systematic process that may be preplanned and explicitly stated. Test techniques and procedures may be defined in advance, and a sequence of test steps may be specified. "Debugging" is the process of isolation and correction of the cause of an error.

"Antibugging" is defined as the philosophy of writing programs in such a way as to make bugs less likely to occur and when they do occur, to make them more noticeable to the programmer and the user. In other words, as much error checking as is practical and possible in each routine should be performed.

# 4.2 Computer Programming Test and Evaluation

The quality assurance provisions for test consists of the normal testing techniques that are accomplished during the construction process. They consist of design and code walk-throughs, unit testing, and integration testing. These tests are performed by the design team. Structured design, design walk-through and the incorporation of "antibugging" facilitate this testing by exposing and addressing problem areas before they become coded "bugs."
